## Offering Seamless Tracking of Air Cargo Containers and Pallets

Unit Load Devices (ULD) are a valuable asset in any air carrier's wide body operation. Containers and pallets must be available in the right place at the right time to meet today's global air cargo demands. When air carriers cannot account for a specific ULD during regularly scheduled inventory reporting, they are forced to purchase costly replacements. Air carriers can avoid lost sales and other severe operating consequences by turning to the CORE ULD Tracking service.

With a CORE tagged ULD, you now can track in real-time the freight contained in your ULDs. Associating waybills with tagged ULDs effectively links freight and mail to a trackable unit. Carriers can automatically track freight and mail without human intervention and with no disruption to existing processes.

Our service tracks these valuable assets in real-time. Each ULD is equipped with a Bluetooth tag. The tags are attached to existing equipment per the manufacturer's and the air carrier's specifications without having to re-certify the ULD. Once the tag is attached, no other human intervention is necessary.

The data is transmitted to our network via cellular or Wi-Fi connections. Subscribers to the network can access the status of their ULDs anytime, anywhere – through desktops, laptops, tablets, smartphones or any internet-enabled device.

*With over 1300 locations, our technology provides visibility, insight, and intelligence to track ULDs anywhere, anytime.*
